See X05248 for corresponding normal gene sequence
In the defective LDL-receptor gene the deletion courred between two
alu-repetitive sequences, that are in the same direction, the
deletion eliminates exons 13 and 14 and changes the reading frame
of the resulting spliced mRNA.
Data kindly reviewed (07-DEC-1987) by HUMPHRIES S.

See X05250 for corresponding normal gene sequence
In the defective LDL-receptor gene the deletion ocurred between two
alu-repetitive sequences, that are in the same direction, the
deletion eliminates exons 13 and 14 and changes the reading frame
of the resulting spliced mRNA.
Data kindly reviewed (07-DEC-1987) by HUMPHRIES S.

No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Description
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Human

                                                                                                                                                                                                                                                                                                                                                                    decelimining potymorphic totals for descentanting potymorphic totals.

Claim 1: Page 218; 310pp; English.

X10269-X1237 are human DNA fragments which contain biallelic polymorphic
X10269-X1237 are human DNA fragments which contain biallelic polymorphic
X10269-X1237 are human DNA fragments which have been isolated using the primers represented in
X09121-X10268. The base occupying the polymorphic site is indicated by
the appropriate IUPAC-IUB ambiguity code. These fragments can be used in
methods for determining polymorphic forms in an individual for use in
e.g. forensics, paternity testing or for phenotypic typing for diseases
such as agammaglobulinemia, diabetes insipidus, Lesch-Nyhan syndrome,
muscular dystrophy, Wiskott-Aldrich syndrome, Pabry & disease, familial
hypercholesterolemia, polycystic kidney disease, hereditary
spherocytosis, von Willebrand's disease, tuberous sclerosis, hereditary
contribute telangiectesia, familial colonic polyposis, Ehlers-Danlos
syndrome, osteogenesis imperfecta, acute intermittent porphyria,
autoimmune diseases, inflammation, cancer, diseases of the nervous
syndrome, osteogenesis imperfecta microrganisms, and characteristics such
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             22975 GTGGCTCATGCCTGTAATCCCAGCACTTTGAGAGGCTGAAGAAGGAGGATCGCTTGAGTC 23034

PT determining polymorphic forms for use in e.g. forensics, paternity testing or phenotypic typing for disease

CI aim 1; Page 219; 310pp; English.

CI X10280-X12937 are human DNA fragments which contain biallelic polymorphic markers which have been isolated using the primers represented in comparisons. The page 219; 310pp; English.

CI X10280-X12937 are human DNA fragments which contain biallelic polymorphic comparisons. The appropriate IUPAC-IUB ambiguity code. These fragments can be used in comparison for determining polymorphic forms in an individual for use in comparisons, page and the sample of the code of the
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       22975 GTGGCTCATGCCTGTAATCCCAGCACTTTGAGAGGCTGAAGAAGGAGGATCGCTTGAGTC 23034

Sequences shown in V41230 to V41247 represent nucleotide sequences of Sequences shown in V41230 to V41247 represent nucleotide sequences of mouse EST from tagged CDNA clones. These are used in the method of the invention of screening for human developmental genes. The method comprises inserting a promoterless reporter gene into a non-primate mammalian embryonic stem cell (ESC) genome and identifying cellular transcripts that encode the reporter gene product. Fragments of genes encoding these transcripts are cloned and sequenced. A gene encoding a transcript that includes unknown sequences is selected and expression level of the gene encoding the transcript, or part of it, in different cell types and/or different developmental stages is detected. A gene showing differential expression is selected and expression levels of a
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                0; Gaps

determining polymorphic forms for use in e.g. forensics, paternity

PT determining polymorphic forms for disease

Calain 1: Page 219: 310pp: English.

Cx10269-X12937 are human DNA fragments which contain biallelic polymorphic

X10269-X12937 are human DNA fragments which contain biallelic polymorphic

Cx10269-X120368 The base occupying the polymorphic site is indicated by

Cx 09121-X10268 The base occupying the polymorphic site is indicated by

Cx 09121-X10268 The base occupying the polymorphic site is indicated by

Cx 09121-X10268 The base occupying the polymorphic such can be used in

Cx 09121-X10268 The base occupying the polymorphic such occupancy in the second of the superpriate IUPAC-IUB ambiguity ocder. These fragments can be used in

Cx methods for determining polymorphic forms in an individual for use in

Cx of cremsics, paternity testing or for phenotypic typing for diseases

Cx or forensics, paternity alaberes insipidus, Lesch-Nyhan syndrome,

Cx muscular dystrophy, Wiskott-Aldrich syndrome, Pabry's disease, familial

Cx oppercholsterorlemia, polycystic kidney disease, hereditary

Cx phenotosterolemia polycystic kidney disease, hereditary

Cx phenotosterolemia polycystic kidney disease, hereditary

Cx phenotosterolemia polycystic kidney disease, thereditary

Cx phenotosterolemia polycystic kidney disease, thereofits

Cx altocimmune diseases, inflammation, cancer, diseases of the nervous

Cx system, infection by pathogenic microorganisms, and characteristics such

Cx altocimmune diseases, inflammation, cancer, diseases of the nervous

Cx system, infection by pathogenic microorganisms, and characteristics such

Cx altocimmune diseases, inflammation, cancer, diseases of the nervous

Cx system, infection by pathogenic microorganisms, and characteristics such

Cx altocimmune diseases, inflammation, cancer, diseases

Cx drugs or therapeutic treatments. The isolated polymorphic nucleic acid

Cx concert, diseases

Cx sequents or the repetitive or prophymorphic nucleic or prophylasis.
                                                                                                                                                                                                                                                                                                                                                                                                         ö
                   different developmental stages, using the non-primate transcrift as probe is detected. A homologus gene having the same pattern of tit is used to identify the homologus human gene. The ESC transcripts it is used to identify the homologus human gene. The ESC transcripts identified by this method are used to generate transgenic animals selected from rats, hamsters, rabbits, dogs, pigs, horses, cows, monkey, babbon or chimpanzee for study of gene function. The method provides rapid and large scale screening for human developmental genes, and eliminates the need to analyse reporter gene expression in embryos. Sequence 86 BP; 16 A; 28 C; 30 G; 12 T;
                                                                                                                                                                                                                                                                                                                                                                                                                                                               Alana biallelic polymorphic DNA fragment EST98276a.

Human biallelic polymorphic DNA fragment EST98276a.

X10269-X12937 are human DNA fragments which contain biallelic polymorphic

```
Hudson 1, Landauder Es, wang D;
Hudson 1, Landauder Es, wang D;
Rew isolated nucleic acid segments from the human genome - used for determining polymorphic forms for use in e.g. forensics, paternity
testing or phenotypic typing for disease
Claim 1; Page 218; 310pp; English.
X10269-X12937 are human DNA fragments which contain biallelic polymorphic
X10269-X12937 are human DNA fragments which contain biallelic polymorphic
X10269-X12937 are human DNA fragments which expresented in an expersa which have been isolated using the polymorphic site is indicated by
X09121-X10268. The base occupying the polymorphic site is indicated by
the appropriate IUPAC-IUB ambiguity code. These fragments can be used in methods for determining polymorphic forms in an individual for use in
e.g. forensics, paternity testing or for phenotypic typing for diseases
Such as agammaglobulinemia, diabetes insipidus, Lesch-Nyhan syndrome,
muscular dystrophy, Wiskott-Aldrich syndrome, Fabry's disease, familial
hypercholesterolemia, polycystic Addeey disease, hereditary
spherocytosis, yon Willebrand's disease, tuberous scierosis, hereditary
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                ó
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       haemorrhagic telangiectasia, familial colonic polyposis, Ehlers-Danlos syndrome, osteogenesis imperfecta, acute intermittent porphyria, autoimmune diseases, inflammation, cancer, diseases of the nervous system, infection by pathogenic microorganisms, and characteristics such as longevity, appearance (e.g. baldness, obesity), strength, speed, endurance, fertility, and susceptibility or receptivity to particular

A1020 74.129; aten mindin Day languable, which collecting the primers represented in X09121-X10268. The base occupying the polymorphic site is indicated by the appropriate UUPAC-TUB ambiguity code. These fragments can be used in methods for determining polymorphic forms in an individual for use in e-g. forensics, paternity testing or for phenotypic typing for diseases. In e-g. forensics, paternity testing or for phenotypic typing for diseases. In a sagammaglobulinemia, polyworthic syndrome, Fabry's disease, familial hypercholesterolemia, polycystic kidney disease, hereditary spherocytosis, von Willebrand's disease, tuberous sclerosis, hereditary spherocytosis, von Willebrand's disease, tuberous sclerosis, hereditary spherocytosis, von Willebrand's disease, tuberous sclerosis, hereditary spherocytosis imperfecta, acute intermittent porphyria, autoimmune diseases, inflammation, cancer, diseases of the nervous syndrome, osteogenesis imperfecta, acute intermittent porphyria, syndrome, diseases, inflammation, cancer, diseases of the nervous sa longevity, appearance (e-g. baldness, obesity), strength, speed, endurance, fertility, and susceptibility or receptivity to particular drugs or therapeutic treatments. The isolated polymorphic nucleic acid segments can also be used to produce medicaments for the treatment or prophylaxis of such diseases.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              ö

CC X10269-X12937 are human DNA fragments which contain biallelic polymorphic

CC X10269-X12937 are human DNA fragments which contain biallelic polymorphic

CC A10269-X12937 are human DNA fragments which contain biallelic polymorphic

CC A10269-X12937 are human DNA fragments which contains a indicated by

CC A10269-X12937 are human DNA fragments of a indicated by

CC A10269-X12937 are human DNA fragments of an individual for use in

CC A10269-X12937 are human DNA fragments in an individual for use in

CC Such as agammaglobulinemia, diabetes insipidus, Lesch-Nyhan syndrome,

CC such as agammaglobulinemia, diabetes insipidus, Esch-Nyhan syndrome,

CC such as agammaglobulinemia, diabetes insipidus, Esch-Nyhan syndrome,

CC such as agammaglobulinemia, familial colonic polyposis, Bhiers Danios

CC sheer of the amportant familial colonic polyposis, Bhiers Danios

CC such as syndrome, osteogenesis imperfecta, acute intermittent porphyria,

CC autoimmune diseases, inflammation, cancer, diseases of the nervous

CC syndrome, osteogenesis imperfecta, acute intermittent porphyria,

CC autoimmune diseases, inflammation, cancer, diseases, and characteristics such

double-stranded DNA, which comprises one of the 7837 "GS" sequences double-stranded DNA, which comprises one of the 7837 "GS" sequences given in T19001-T26837 and which to able to hybridise to part of burnan genomic DNA, cDNA or mRNA is claimed. The GS (Gene Signature) sequences were obtained from 3'-directed cDNA libraries prepared from various human tissues; synthesis of cDNA was initiated from the 3'-end of mRNA by using poly(T) as the sole primer. Since the 3'-cuntranslated sequence is unique to a particular mRNA species, almost all the 3'-oriented cDNAs hybridise with specific mRNAs. Each library is constructed so as to reflect accurately the relative abundance of different mRNAs in the particular tissue from which it was derived. The appearance frequency of a given GS in a cDNA library can be determined (esp. using primers and probes derived from the GS sequences) as a means of diagnosing abnormal cell function or for

The GS (Gene Signature) sequences were obtained from 3'-directed cDNA libraries prepared from various human tissues; synthesis of cDNA was initiated from the 3'-end of mRNA by using poly(T) as the sole primer. Since the 3'-untranslated sequence is unique to a particular mRNA species, almost all the 3'-oriented cDNAs hybridise with specific mRNAs. Each library is constructed so as to reflect accurately the relative abundance of different mRNAs in the particular tissue from which it was derived.
untranslated sequence is unique to a particular mRNA species, almost all the 3'-oriented cDRNs hybridise with specific mRNAs. Each library is constructed so as to reflect accurately the relative abundance of different mRNAs in the particular tissue from which it was derived. The appearance frequency of a given GS in a cDNA library can be determined (esp. using primers and probes derived from the GS sequences) as a means of diagnosing abnormal cell function or for recognising different cell types.

A single-stranded DNA (or its complementary strand or the corresp. A single-stranded DNA (or its complementary strand or the corresp. double-stranded DNA) which comprises one of the 7837 "GS" sequences of given in T19001-T25687 and which is able to hybridise to part of human genomic DNA, CDNA or mRNA is claimed. The GS (Gene Signature) sequences were obtained from 3'-directed CDNA libraries prepared from various human tissues; synthesis of CDNA was initiated from the size of from various human tissues; synthesis of cDNA was initiated from the size of mRNA by using poly(T) as the sole primer. Since the 3'-end of mRNA by using poly(T) as the sole primer. Since the 3'-end of mRNA by using poly(T) as the sole primer. Since the 3'-end then all the 3'-oriented cobMAs hybridise with specific mRNAs. Each library is constructed so as to reflect accurately the relative abundance of different mRNAs in the particular tissue from which it was derived. The appearance frequency of a given GS in a cDNA library can be determined (esp. using primers and probes derived from the GS sequences) as a means of diagnosing abnormal cell function or for sequence 108 BP; 18 A; 23 G; 28 T;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 3774 GATCTCTTGACCTTCTGATCCGCCTGCCTTGGCTTCCCAAAGTGCTGGGATTACAGGTGT 3833

Telentifying gene signatures in 3'-directed human cDNA library - e.g. dentifying gene signatures in 3'-directed human cDNA library - e.g. reflects relative abundance of corresp. mRNA in specific human rissues

Claim 1; Page 1942; 2245pp; Japanese.

A single-stranded DNA) which comprises one of the 7837 "GS" sequences given in T19001-T28637 and which is able to hybridise to part of human genomic DNA, cDNA or mRNA is claimed. The GS (Gene Signature) sequences were obtained from 3'-directed cDNA libraries prepared from various human tissues; synthesis of cDNA was initiated from the siden of mRNA by using poly(T) as the sole primer. Since the 3'-curtanslated sequence; untranslated sequence Is unique to a particular mRNA species, almost all the 3'-oriented cDNAs hybridise with specific mRNAs. Each library is constructed so as to reflect accurately the relative abundance of different mRNAs in the particular tissue from which it was derived. The appearance frequency of a given GS in a cDNA library can be determined (esp. using primers and probes derived from the GS sequences) as a means of diagnosing abnormal cell function or for recognising different cell types.

```
Pred. No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      SUMMARIES

Double-stranded cDNA was ligated to ECORI adaptors, 5 cycles of PCR applied to the PCR product subcloned into pAMP10 by the UDG-cloning method (Life Technologies). Average insert size is 600 bp. NOTE: Not directionally cloned. This library was

Patent No. 5948888
GENERAL INFORMATION:
APPLICANT: Wands, Jack R.
TITLE OF INVENTION:
TITLE OF INVENTION: Allaheimer's Disease
TITLE OF INVENTION: Allaheimer's Disease
NUMBER OF SEQUENCES: 121
CORRESPONDENCE ADDRESS:
ADDRESSEE: Sterne, Kessler, Goldstein & Fox P.L.L.C.
STREET: 1100 New York Avenue, Suite 600
CITY: Washington
APPLICANT: de la Monte, Suzanne
PAPLICANT: Wands, Jack R.
TITLE OF INVENTION: Neural Thread Protein Gene Expression and Detection
TITLE OF INVENTION: of Alzheimer's Disease
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             2840 GCCCAGCTAATTTTTGTATTTTTAGTAGAGATGGGGTTTCACTATGTTGGCCAGGCTAGT 2899

Patent No. 5830670
GENERAL INFORMATION
APPLICANT: de la Monte, Suzanne
APPLICANT: Wands, Jack R.
TITLE OF INVENTION: Neural Thread Protein Gene Expression and Detection
TITLE OF INVENTION: of Alzheimer's Disease
NUMBER OF SEQUENCES: 121
CORRESPONDENCES: Sterne, Kessler, Goldstein & Fox P.L.L.C.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 1433 TCGGGAGTTTGAGACCAGCCTGGCCAATATGGCGAAACCCTGTCTCTACTAAAAATACAA 1492

See X05248 for corresponding normal gene sequence
In the defective LDL-receptor gene the deletion courred between two
alu-repetitive sequences, that are in the same direction, the
deletion eliminates exons 13 and 14 and changes the reading frame
of the resulting spliced mRNA.
